APPLYING RECURSIVE POLICY FOR SCOPING OF ADMINISTRATION OF POLICY BASED NETWORKING

Abstract

5   A network super-administrator can delegate to one or more network sub-administrators a scope of authority to create policy-based rules used to control access and usage of network resources. The super-administrator can define the delegated scope of authority through a set of policy-based rules and can indicate to which sub-administrator the scope of authority is delegated through an identifier associated with the particular sub-administrator.
